Hi Simon,

The accuracy depends on many factors: how big the location is, how many obstacles are there, how many people, etc. On average, in locations bigger than 100 sq m you can expect accuracy of 3–4 meters on average. We're working on scaling it up to very big venues (think thousands of sq m) without sacrificing accuracy.

Right now, Estimote Indoor Location works only if the app is active (running on screen). You usually have the phone locked when it's in your pocket, so at the current stage it wouldn't work at all. However, by the end of the year we will release an update allowing for indoor location in the background too. It will of course impact the accuracy, but it's hard to commit to specific numbers yet. Will be possible when we're closer to the release.

Keep in touch.

Cheers.
